

Things that you will be graded for in your code (Very Important)

- Clear identification of domain entities and their relations with appropriate object modeling
- Clear and logical separation of responsibilities - (emphasis on single responsibility)
- Functionality should not be dumped in a single class, method or file
- Clean Code (Proper Naming Conventions, Readable and self documenting code, avoid redundant commenting)
- Easy to understand, not too complex code (something which can be extended by any other person) and of course functional completion
- Atomicity and Coverage of Unit Tests
